

TypeScript Project 2 ATM:

Develop a TS program that show the working of an ATM machine such

- User should login by entering his/her unique account number and a secret PIN
- User can check account balance
- User can withdraw money
- User can check his/her previous transections in the current login
- User should be asked at the end of each function that if he/she wants to end transections or perform any other transections if the user choose more transections he/she must be shown all the options again and he / she can perform any transections.

In the current login means if user logged in and performed 5 transections he/she have an option to check these 5 transections

If he/she choosed to end the transections the data should be removed.
